#### HARNESSES LEADS & MORE

## WHY A D' ELLIS® HARNESS?

Did you know that scientific studies have shown that your dog can get all kinds of medical conditions and diseases by wearing a collar, and that wearing a collar imposes various restrictions on your dog? Even changes in personality, irritability and impaired social skills may occur. The pressure in and behind the eyes is increased considerably and could lead to problems with vision. External pressure on the thyroid can cause damage and hypothyroidism, with symptoms like chronic stress, fatigue, as well behavioral changes and disturbances of metabolism.

## MAIN PROBLEMS WITH THE USE OF A COLLAR

Headache, muscle pain in neck and back, reduced mobility, problems with eating and drinking, changes in metabolism, cough, stomach and intestinal problems, change in heartrate, increased stresslevels and eyeproblems.

The soft tissue of the throat in dogs is exactly the same as in humans. Feel yourself how unpleasant it is to even exert slight pressure on your larynx and the rest of your throat.

## ALL HARNESSES AVAILABLE COMMERCIALY ARE GOOD HARNESSES?

Unfortunately the answer is no. Sold are all kinds of harnesses, with the most exotic names that still pose limitations or pain.

### **Yes, but wearing a harness my dog is tougher and pulling increases.**

A common misconception. A dog is not stronger or pulls more wearing a harness. A dog pulls because he encounters an interesting smell, or another dog encounters and in most cases because it is learned behavior. If you draw the line when experiencing problems please get in touch with a good trainer or visit the website of Turid Rugaas (turid-rugaas.no). Also highly recommended "What do I do when my dog pulls", published as book and DVD and also available at most vendors of d' Ellis® harnesses.

Detailed information about the use of a harness versus collar and the results of recent scientific studies can be found on our website dellis.nl or ask your vendor.

## FEATURES OF THE D' ELLIS® HARNESSES

Designed on the principle comfort and safety for your dog. The harness distributes under all circumstances, the pressure on the chest and protects the fragile neck. Gives full freedom of movement in muscles and joints, and prevents chafing behind the elbows. The unique characteristics are suitable for dogs who are reluctant or fearful to touch the head or neck. Adding additional closures helps your dog step in the harness with no need to pull it over the head.

### **Sizes and fit**

Over 30 years of observation and study underlies the current design. Suitable for all breeds, types and construction. 5-fold adjustable. The harness does not cause pain, limitation, friction on the skin or other discomfort. Your dog retains complete freedom of movement.

### **Customization and modifications**

Although the harnesses are available in seven standard sizes from XXXS / XL occasionally the physique of a dog can be so different, that does not fit a standard size. Some medical reasons, for example an amputation can prevent this. As an additional and unique service is also a fully adapted and customized harness available at no extra cost. Ask your dealer for advice.

### **Production**

Harnesses and leads are handmade in our own studio, with attention to every detail. Each harness is before it leaves our premises again checked on all components to ensure safety and comfort.

### **Band/Webbing**

The band that we use for our harnesses are made of spun nylon 6 (polyamide) which provides a high strength, elasticity, softness and colorfastness. Nylon 6 is fully recyclable and therefore applies corporate social responsibility in our vision.

### **The plastic components**

The adjusting clips, and buckles are made of polyacetal, a plastic known for its excellent mechanical properties such as strength and hardness. Polyacetal is often used as a replacement for metallic components when both strength and lightness is desired. For safety and comfort for your dog to ensure we use slightly curved, rounded clips and buckles without sharp corners. All deliveries of plastic parts for shipment to our workshop are thoroughly tested for quality, durability, breaking and ethical characteristics. Test reports are available in our atelier.

### **The metal components**

The rings and carabiners we use come from human orthopedic industry and are used mainly in braces and consequently cause no allergic reactions.
